1. About This Manual

1.1. Important User Information

Copyright © 2012 by Despatch Industries.

All rights reserved. No part of the contents of this manual may be reproduced, copied, or transmitted in any form or by any means including graphic, electronic, or mechanical methods or photocopying, recording, or information storage and retrieval systems without the written permission of the publisher, unless it is for the purchaser's personal use.

Printed and bound in the United States of America.

The information in this manual is subject to change without notice and does not represent a commitment on the part of Despatch Industries. Despatch Industries does not assume any responsibility for any errors that may appear in this manual.

In no event will Despatch Industries be liable for technical or editorial omissions made herein, nor for direct, indirect, special, incidental, or consequential damages resulting from the use or defect of this manual.

---

Before operating this equipment, carefully read instruction manual.

Values displayed on screens are examples only. Though those values may be typical, contact Despatch Industries for the final value.

Users of this equipment must comply with operating procedures and training of operation personnel as required by the Occupational Safety and Health Act (OSHA) of 1970, Section 5 and relevant safety standards, as well as other safety rules and regulations of state and local governments. Refer to the relevant safety standards in OSHA and National Fire Protection Association (NFPA), section 86 of 1985.
Danger!

Only fully-trained and qualified personnel should setup and maintain this equipment. Improper setup and operation of this equipment could cause an explosion that may result in equipment damage, personal injury or possible death.

The information in this document is not intended to cover all possible conditions and situations that might occur. The end user must exercise caution and common sense when installing or maintaining Despatch Industries products. If any questions or problems arise, call Despatch Industries at 1-888-DESPATCH or 1-952-469-5424.

1.2. Manufacturer & Service

The RAD oven series, which includes RAD2-13, RAD2-19 and RAD2-35, is manufactured by Despatch Industries.

Despatch has specialized in thermal processing for over 100 years. Technical expertise gained over those years helps provide innovative solutions to critical applications in vertical markets and cutting edge technology worldwide. Despatch products are backed by a drive for long-term customer satisfaction and a strong sense of responsibility. The worldwide network of factory-trained Service Professionals is available to support your Despatch equipment. From full service preventive maintenance to routine repair and certified calibration and uniformity, the Despatch service network is positioned to respond to your business needs. Our service programs are customized to meet your specific needs using our Advantage Service Assurance Program (ASAP). For more information on ASAP, visit www.despatch.com.

1.3. Organization of this Manual

This owner’s manual contains a the most comprehensive set of information for the Despatch RAD oven series, including installation instructions, theory of operation, and operating instructions, among other things. To save time and expense in case of trouble, it is urged that the operators search this manual for helpful suggestions before requesting factory assistance.
1.4. **Conventions**

</table>

Refer to the Design Information and Specification labels on your oven for temperature specifics pertaining to your oven (Figure 1).

---

* Uniformity figures are based on a nine-point test conducted in an empty oven after stabilization period. Uniformity can vary slightly depending on unit and operating conditions. Minimum operating temperature and cooling times are based on 20°C ambient temperature measured at the fresh air inlet with the fresh air and exhaust dampers fully open. Specifications are subject to change without notice.
1.5.4. Power

Line voltages may vary in some geographies. If the line voltage for your RAD oven varies more than 10% from the oven voltage rating, electrical components such as relays and temperature controls may operate erratically.

- If the line voltage is lower than the oven voltage rating, heat-up time may be significantly longer and motors may overload or run hot.
- If the line voltage is higher than the nameplate rating, motors may run hot and draw excessive amperage.

Refer to the Electrical Specifications on your oven for the specifics pertaining to your oven (Figure 2).

**Warning!**

*This oven is not designed for use with flammable material. If your process involves flammable material, see the RFD Class A series.*

† An oven designed for 240 volts (see oven nameplate) will operate satisfactorily on a minimum of 208 Volts, but will result in 25% reduced heater output. If your power characteristic is lower, contact Despatch Industries.

‡ 50 hertz electrical is available on all models.
2. Safety

2.1. Safety Information

Do not work on the RAD oven without reading and understanding this section which contains important information and warnings. Ignoring these warnings can result in death, serious injury or damage to the machine and product.

2.1.1. Lockout

Machine lockout places the RAD oven into a zero energy state and prevents accidental machine start up. Always follow the Lockout Procedure described in this section before cleaning, maintaining or repairing the RAD oven.

**Danger!**

An accidental start-up, while working on the RAD oven, can result in serious injury or death.

**Danger!**

Electrical panels contain high voltage. Disconnect and lock out the power supply before working inside any electrical panels. Failure to lock out the power supply can result in death or injury.

2.1.1.1. Lockout Requirements

1. Every power source that can energize any element of the RAD oven must be shut off at the closest possible power source. This includes air, water, electricity, and the Disconnect Switch.
2. After energy sources are locked out, test to ensure circuits are de-energized.

2.1.1.2. Lockout Procedure

Personnel authorized to lockout equipment must have the necessary locks to perform the lockout.

1. Physically disconnect all electrical power to the machine or lockout the appropriate breaker or disconnects.
2. Close all valves and bleed off any pressure.
3. Test for power by attempting a start with the machine controls.
4. Identify the Lockout Condition with a tag on the electrical disconnect and pneumatic shut off valve.
5. When work is complete, remove all tags and restore the machine to its working state.
2.2. **Maintenance**

Only qualified and trained personnel should perform maintenance or repair.

2.3. **Electrical Power**

Only qualified and trained personnel should perform electrical maintenance or electrical repair.

---

**Danger!**

*High voltage present on this equipment, service by authorized personnel only. Contact with energized electrical sources may result in serious injury or death.*

- Before performing maintenance, disconnect all electrical power from the machine. Use a padlock and lockout all disconnects feeding power to the machine.
- Never clean or repair the oven when in operation.
- Unauthorized alterations or modifications to RAD oven are strictly forbidden. Never modify any electrical circuits. Unauthorized modifications can impair the function and safety of the RAD oven.

2.4. **Fire**

Keep the RAD oven clean and free of scrap materials, oil or solvents to prevent the possibility of fire. In the event of fire, follow these steps.

1. Leave the door as it is.
2. Shut off electricity.
3. De-energize the machine immediately by turning OFF the **DISCONNECT SWITCH**.
4. Turn off the remote main disconnect (customer supplied disconnect).
5. Shut off fuel.
6. Call the fire department.
7. Stay away.

---

**Danger!**

*Always disconnect all power before extinguishing a fire. Attempting to extinguish a fire in a machine connected to electrical power can result in serious injury or death.*

2.5. **Equipment Lockout Requirements**

To prevent injury or equipment damage during inspection or repair, the RAD oven must be locked out.
2.5.1. **Optional Disconnect Switch**

The RAD oven has an optional Disconnect Switch (Figure 3). This Disconnect Switch is connected to the load break switch behind the panel that disconnects or connects power from the main line. When a risk of personal injury or damage to the RAD oven exists, turn OFF the **DISCONNECT SWITCH** on the front of the oven. This shuts off all electrical power to the oven.

Figure 3. Disconnect Switch.
3. **Theory of Operation**

3.1. **The RAD Oven Series**

The RAD ovens (Figure 4) feature horizontal recirculating airflow to ensure exceptional temperature uniformity throughout the oven. A high-volume fan circulates air through perforated, stainless steel walls to create a constant horizontal airflow across all sections of the oven. The result is proven reliability in demanding production and laboratory applications, such as curing, drying, sterilizing, aging, and other process-critical applications.

3.2. **Damper Control**

Fresh air and exhaust dampers (Figure 5 and Figure 6) control the amount of air exchanged as well as the oven chamber pressure. When the fresh air damper is closed and the exhaust damper is open, oven chamber pressure tends toward negative. When the fresh air damper is open and the exhaust damper is closed, the oven chamber pressure tends toward positive (Table 1).

A negative oven pressure may draw ambient air into any opening, causing cool spots to occur. The slightly pressurized chamber produces the effect of pushing air to the corners of the chamber. However, too much positive pressure may force hot air or process vapors out of any openings in the oven into the work area. Ideally, the fresh air and exhaust dampers should be closed as much as possible and the oven should be maintained at a neutral or slightly positive pressure.
3.2.1. **Determining Damper Settings**

The optimum setting for the amount of fresh air that should be distributed into the chamber depends on several factors. These factors include ambient environment temperature, load conditions, load distribution, heat-up rates, cool-down rates, desired temperature uniformity and, most importantly, the desired operating temperature. Carefully consider existing engineering tradeoffs while using guidelines to determine the fresh air damper setting.

In general, the damper should be set so that the amount of fresh air flowing into the chamber agrees with the desired operating temperature conditions. The following paragraphs show the considerations involved with various damper position settings.

### 3.2.1.1. Fresh Air Damper Fully Closed Position

The chamber achieves maximum attainable heat-up rates when the fresh air damper lies in the full closed position. With the damper in the full closed position, the chamber will operate at the desired temperature using the minimum amount of power. In most cases, the oven also efficiently operates at the chamber’s maximum operating temperature when in the full closed position.

### 3.2.1.2. Fresh Air Damper Fully Open Position

The chamber operates at its minimum operating temperature with the fresh air damper in full open position.

Friction heat from the air recirculation system builds up in the chamber. This causes chamber temperature to rise slightly even without the heating system on. The chamber reaches thermal equilibrium temperature after the recirculation motor runs for an extended period of time.

---

**Warning!**

*Maintain slight positive pressure to regulate heat.*

Too much positive pressure in an oven can create a high outer skin temperature as hot air is forced out through panel joints and around door seal. High outer skin temperature could warp the front of the oven.

</table>
The chamber cannot readily dissipate heat generated by friction without a fully open fresh air damper. With the fresh air damper fully open, the thermal equilibrium temperature is the minimum operating temperature of the chamber.

| ![Damper Symbol] | When the damper is in full open position, the oven may not be able to heat to the maximum oven operating temperature. |

### 3.2.1.3. Exhaust Damper Control

Adjusting the exhaust damper (Figure 6) aids in pressurizing the chamber.

### 3.3. Optional Adjustable Louvers

| ![Damper Symbol] | This section applies only to ovens that include the optional adjustable louvers. Ovens without the louver option do not have adjustable airflow. |

RAD oven series come standard with perforated supply and exhaust panels (Figure 7). Optional adjustable louvers provide an extra measure of airflow customization. Figure 8 shows the initial factory settings for the optional louvers.

![Figure 7. Standard perforated panels and adjustable louvers.](image)
3.3.1. **Purpose of Adjustable Airflow**

Optional adjustable airflow has several purposes in the RAD oven:
1. Ability to get the best temperature and airflow uniformity.
2. Ability to “spot heat” special areas or specific parts of load.
3. Ability to prevent air flowing out or sucking in through the entrance and exit openings in the oven.

3.3.2. **Supply Air Adjustment**

The adjustment of supply louvers is directly related to temperature uniformity in the work chamber. A general guideline is that more heat is required next to doors, windows and outside walls so, therefore, more air is required to deliver that heat.

3.3.3. **Return Air Adjustment**

Ensure there are no restrictive conditions which may limit the amount of air handled by the return ducts. Restrictions in return air ducts may decrease the amount of air handled by the fan and/or may result in pressurized conditions in the work chamber. The initial settings for return louvers should be 50% more open than the supply louvers. Final adjustment may be necessary.

---

**Warning!**

*Maintain slight positive pressure to regulate heat.*

*Too much positive pressure in an oven can create a high outer skin temperature as hot air is forced out through panel joints and around door seal. High outer skin temperature could warp the front of the oven.*
3.4. **The Protocol 3 Controller**

The Protocol 3™ is a microprocessor based digital temperature controller designed for simple and flexible oven operation (Figure 9). The Protocol 3 controller operates as a dual-functioning controller/High Limit instrument. The control portion utilizes a time-proportioning voltage signal to control heating devices with minimal temperature fluctuations.

The High Limit portion protects the product and/or the oven from overheating. If the product being processed has a critical high temperature limit, the High Limit setpoint should be set to a temperature somewhat below the temperature at which the product could be damaged. If the product does not have a critical high temperature limit, the High Limit setpoint should be set 5 to 15 degrees higher than the maximum programmed setpoint at which the oven will operate.

The purchaser is responsible for setting the High Limit Control per the instructions in this manual.

**Danger!**

*Failure to attend to High Limit Control Warning may result in property damage, serious bodily injury or death.*

The Protocol 3 controller provides three primary operating modes:
- Manual: Oven operates continuously at a fixed temperature until turned off.
- Timer: Oven operates at a fixed temperature for a user-selected time period, and then automatically turns off.
- Profile: Temperatures increase or decrease as defined by 255 segments that can be allocated to 64 ramp and soak profiles. The profiles can be linked to provide additional temperature combinations.

Review the Protocol 3 Controller Owner’s Manual for more information.
3.5. Optional High Limit Audible Alarm

High Limit audible and visual alarm is a red light and small alarm horn located on the front of the control panel (Figure 10). The alarm is sounded if a High Limit condition occurs. A switch is provided to silence the alarm. This alarm has a range of 80dB at 2 ft (0.6 m).
4. **Assembly & Setup**

Assembly and Setup provides directions for unpacking and installing your RAD oven.

**Danger!**

This equipment must be installed by a licensed electrician who is experienced with combustion safeguard control systems and understands the functions of an interlocking switch such as gas pressure switches.

| If any warning, danger, or information sign has been damaged or lost, contact the customer service department of Despatch Industries, Inc. for replacement. |

4.1. **Unpack & Inspect The RAD Oven**

Remove all packing materials and thoroughly inspect the oven for any damage that might have occurred during shipment.

- Note the condition of the carton and plastic cover sheet inside the carton.
- Observe all outside surfaces and corners of the oven for scratches and dents.
- Check oven controls and indicators for normal movement, bent shafts, cracks, chips or missing parts such as knobs and lenses.
- Check the door and latch for smooth operation.

4.1.1. **If Damaged During Shipping**

If damage occurred during shipping:

1. Contact the shipper immediately and file a written damage claim.
2. Contact Despatch Industries (1-800-473-7373 or 1-952-469-8230 or service@despatch.com) to report your findings and to order replacement parts for those damaged or missing. Send a copy of your filed damage claims to Despatch Industries (Despatch Industries, 8860 207th Street, Lakeville, MN 555044, USA).
3. Check the packing list to ensure you received all the specified components of the oven system. Contact Despatch Industries to have any missing products forwarded to you.
4. Complete the warranty card and mail it to Despatch within 15 days after receipt of the equipment.

4.2. **Set up The RAD Oven**

4.2.1. **Select Oven Location**

The Despatch RAD oven is designed to operate in an industrial setting.
4.2.1.1. Placement Requirements

- Place oven directly on the floor.
- Plumb and level the oven to assure proper heat distribution and operation of all mechanical components.
- Do not expose oven to excessive vibration and affix all electrical cabinets.
- If placing the oven in an area where excessive particulate matter exists (such as a construction site or a coal processing center), periodically clean all its electrical compartments. Keep power supply within the specifications provided by Despatch, and use a line conditioner for a facility with an unstable power supply.

4.3. Exhaust Connections

The RAD oven exhaust port is located on the top of the oven (Figure 6). Install an exhaust stack from the discharge opening to the outside of the building. The discharge opening is 17.8 cm (7.0 inches) diameter.

Warning!

Do not use the oven in wet, corrosive or explosive atmospheres unless this oven is specifically designed for a special atmosphere.

Notice

Review oven weight to ensure the foundation is adequate to hold the weight.

Warning!

Do not be careless about restrictions in and around the fresh air and exhaust openings and stacks.

Notice

Flashing through roof or wall must be capable of handling temperatures up to 343°C (650°F).
4.3.1. **Down Drafts**

Where down drafts occur in gravity stacks, their cause should be determined and corrections made without delay. They can cause concentrations of exhaust volatiles within the work chamber, poorly baked products, poor burner operation or the spreading of odors into the factory.

Down drafts may result from insufficient gravity stack height, or its failure to extend above nearby buildings, roofs, pent houses, or other obstructions which cause downward wind movements into the stack. Such causes are usually easily remedied. Or they may result from a negative pressure within the factory caused by excessive gravity or forced exhaust ventilation from the factory. The most effective remedy for this condition is the installation of a “make-up” supply air system equal in capacity to the total exhaust from the factory.

4.4. **Wiring & Power Connections**

See electrical schematics in Section 8.3 for line connections.

<table>
<thead>
<tr>
<th>Flag</th>
<th>The oven must be hardwired directly to the electric supply.</th>
</tr>
</thead>
</table>

<table>
<thead>
<tr>
<th>Flag</th>
<th>Verify proper fan rotation on initial start-up and recheck rotation whenever wiring or electrical component changes are made. Each fan has an arrow showing correct rotation.</th>
</tr>
</thead>
</table>

**Danger!**

All grounding and safety equipment must be in compliance with applicable codes, ordinances and accepted safe practices.
5. Operation

Users and operators of this oven must comply with operating procedures and training of operating personnel as required by the Occupational Safety and Health Act (OSHA) of 1970, Section 5 and relevant safety standards, and other safety rules and regulations of state and local governments. Refer to the relevant safety standards in OSHA and National Fire Protection Association (NFPA), Section 86 of 1985.

Danger!

In case of fire, leave door(s) as they are. Shut off electricity. Shut off fuel. Call the fire department. Stay away.

5.1. Load Oven

Despatch Industries cannot be responsible for either the process or process temperature used, or for the quality of the product being processed. It is the responsibility of the purchaser and operator to see that the product undergoing processing in a Despatch oven is adequately protected from damage.

Carefully following the instructions in this manual will help the purchaser and operator in fulfilling that responsibility.

Avoid spilling on the heater elements or oven floor when loading the oven. Do not place the load on the oven floor plate. Placing the load on the oven floor may cause the load to heat unevenly and the weight may cause shorting out of the heater elements. Use the shelves provided.

Caution!

Always place loads on the shelves provided to avoid possible uneven heating and damage to the oven.
The two shelves are designed to be pulled out about halfway without tipping. Do not overload the shelves. Shelf support capacity is listed in the Capacities section (1.5.2). Do not overfill the oven. Distribute the workload evenly so airflow is not restricted. The workload should not take up more than two-thirds of any dimension of the inside cavity.

5.2. **Pre-Startup Checklist**

- Read this manual carefully and make use of its instructions and explanations. Safe, continuous, satisfactory and trouble-free operation depends primarily on your degree of understanding of the system and your willingness to keep all parts in proper operating condition.
- Verify line voltage. Voltage must correspond to nameplate requirements of motors and controls. Incorrect line voltage can result in serious damage. Refer to Section 1.5.4 for more information.
- Check fresh air and exhaust openings. Do not be careless about restrictions in and around the fresh air and exhaust openings and stacks. Refer to Sections 1.5.2 and 4.3 for information on exhaust specifications and requirements. Under no condition can they be permitted to become so filled with dirt that they reduce airflow.
- For drying applications, open exhaust damper to prevent buildup of moisture.
- For sample heating, close the exhaust damper when no ventilation is required.

**Warning!**

*Do not use flammable solvent or other flammable material in this oven. Do not process closed containers of any substance or liquid in this oven because they may explode under heat.*

5.3. **Operating Procedure**

5.3.1. **Check Fan Rotation**
Check fan rotation after the initial installation and after reconnecting the power supply to ensure fans are running in the correct direction. To check fan rotation:

1. Momentarily toggle **POWER** (Figure 10) to start fans and check rotation.
2. Rotation should correspond to the directional arrows provided.
3. Reverse motor rotation where necessary.

### 5.3.2. Start and Operate the Oven

1. Set the main **Power Disconnect** switch to **ON** (Figure 3).
2. Set **POWER** to **ON**. The recirculation fan will start.
3. Turn **HEAT** to **ON** (Figure 10).
   a. The Heater LED on the controller will light indicate the heater is on and the controller is calling for heat.
   b. The alarm horn will sound if the High Limit trips. Press the **ALARM SILENCE** to silence the alarm.
   c. Allow the oven to cool below the High Limit setting and reset the High Limit.
4. When the door is opened the heater will shut off.
5. Operate the temperature control as desired. If necessary, refer to the Protocol 3 Owner’s Manual for more instruction.

### 5.3.3. Shutdown

1. Set **HEAT** to **OFF**.
2. Allow the fans to run until the oven has cooled below 149°C (300°F).
3. Set **POWER** to **OFF**.

**Warning!**

*Fans should remain in operation until the oven temperature is below 149°C (300°F) to prevent damage to the fan and/or motor bearings.*

If additional information is required regarding the operation of this equipment, please contact Despatch.
5.3.4. **Working with Protocol 3 Operating Modes**

Refer to the Protocol 3 Controller’s Owner Manual for specific information for working with the controller.
6. Maintenance

Do not attempt any service on this oven before setting the main power Disconnect Switch to OFF.

Danger!

Disconnect all power sources before making repairs. Contact with energized electrical sources may result in serious injury or death.

6.1. Checklist

- Keep equipment clean. Gradual dirt accumulation retards airflow. A dirty oven can result in unsatisfactory operation such as unbalanced temperature in the work chamber, reduced heating capacity, reduced production, and the like. Keep the walls, floor and ceiling of the oven work chamber free of dirt, dust, smoke, solvent vapors, or other contaminations.
- Keep all equipment accessible. Allow space for good circulation. Do not permit other materials to be stored or piled against it.
- Do not place load too close to the supply duct. The supply air temperature is somewhat higher than average work space temperature and may overheat or otherwise damage product.
- Do not put product on the floor or in isolated corners where air movement and temperature are not likely to be at average conditions.
- Do not mix thick heavy parts with light parts. The heavy parts require longer to heat and should be treated separately.
- Check safety controls. This should be done daily and never less than once a week.
- Establish maintenance and checkup schedules. Maintain equipment in good repair and make repairs immediately to avoid costly delays.
### 6.2. Maintenance Schedule

6.3. **Check Fans**
Check fan operation by closely observing for abnormal movement or sound. Irregular noise or movement may mean the fan needs repair or replacement. Listen for any irregular noises coming from the fans.

6.4. **Lubrication**
Lubricate all door latches, hinges, door operating mechanisms, and wear surfaces to ensure easy operation.

6.5. **Check Safety Controls**

![Danger!]

*Do not attempt any service on this equipment without setting the main power Disconnect Switch to OFF. Disconnect all power sources before making repairs. Contact with energized electrical sources may result in serious injury or death.*

Make certain the oven controls are free of dirt and debris and function properly.

6.6. **Check High-Limit Controller**
The Protocol 3 controller has an integrated high limit function which disables the heater output when tripped. Check the High Limit controller by:
1. Set the Hi-Limit setpoint below the process temperature. Refer to the Protocol 3 manual as necessary.
2. The oven should heat and trip the High-Limit controller as it reaches the high limit setpoint.
3. If not, contact Despatch.

6.7. **Replacement Parts**
Contact the Service Products Division at Despatch to order or return parts. The Service Products features our Response Center for customer service. A Despatch representative will provide you with an MRA (Material Return Authorization) number that must be attached to the returned part.
for identification. When ordering a replacement part, be sure to give the model number, serial number, and part number to expedite the process.

Contact Despatch with any service needs.

**Danger!**

*Electrical panels contain high voltage. Disconnect and lock out the power supply before working inside any electrical panels. Failure to lock out the power supply can result in death or injury.*

8. Appendices

8.1. Standard Products Warranty

Despatch Industries

Standard Products
Product Warranty

Products Covered by this Warranty
This warranty (the "Warranty") applies to the following Despatch products: L6B, L6B, LAC, LCC, LDC, LDF, LDD, LCD, RAD, RFD, UDF, TAD, TPD, FNC, FPC, TPG, SBD series.

Parts and Materials
Despatch warrants all parts and materials to be free from defects in material and workmanship for a period of:
1. five (5) years from the date of shipment for laboratory oven elements, heating elements,
2. three (3) years from the date of shipment for Protocol Plus, Micro-3, and DES 2500 temperature controllers, and
3. one (1) year from the date of shipment, or 2,000 hours of operation, whichever occurs first, for all other components of the products covered by this warranty.

During the applicable Warranty period, Despatch will repair or replace, at Despatch's option, parts and materials covered by this Warranty.

Labor
During the first 90 days of the Warranty period, Despatch will pay labor costs incurred to remove defective parts and materials, and to reinstall repaired or replacement parts or materials; provided, however, that Despatch's obligation to pay such labor costs shall be subject to the limitation that the removal and/or replacement service must be performed by a Despatch-authorized technician from Despatch's worldwide network of factory-trained professionals at a location within the contiguous United States.

Transportation Costs
All transportation costs to transport defective parts or materials to Despatch, and to transport repaired or replacement parts or materials to Customer, shall be the responsibility of the Customer.

Terms and Conditions
This Warranty shall be deemed valid and binding upon Despatch if and only if the Customer:
1. returns this Warranty Form to Despatch together with the properly packed Defective Product along with shipping instructions to Despatch.
2. returns the return Authorization Number issued by Despatch with the Defective Product.
3. provides Despatch with the Defective Product within 30 days of the Customer's notification to Despatch that a Claim is being filed.

Exclusions
This Warranty DOES NOT cover:
1. damage caused by failure to follow the Operation and Maintenance Instructions for the Defective Product.
2. defects caused by exposure to corrosive atmosphere, normal wear and tear, or by modifications made by Customer or others.
3. defects caused by failure to provide adequate preventive maintenance.
4. defects caused by misuse, abuse, negligence, accident, or improper installation.

Limitations of Liability
Despatch shall not be liable for any indirect, special, consequential, incidental, or punitive damages or penalties of any kind, including without limitation loss of revenue, profits or business opportunities resulting from interruption of process or production. This Warranty does not cover:
1. repair or replacement of parts or materials designed and intended to be expendable or consumable, refrigerants, filters, lamps.
2. routine maintenance; or
3. labor costs incurred for troubleshooting, diagnosis, or testing (except for testing required to verify that a covered defective part or material has been replaced).

Non-Compliance By Customer
Despatch reserves the right to suspend and withhold service under this Warranty if the customer does not meet any of the conditions specified in the Warranty Terms and Conditions.

Customer Furnished Equipment Warranty Limitation
This Warranty does not cover any defects or damages caused by, or resulting from the operation of, equipment supplied by the Customer or any person or entity other than Despatch.

Procedure Upon Discovery of Defects and Emergencies
In the event Customer becomes aware of any defect in the applicable products, Customer must immediately:
1. shut off fuel and/or electricity;
2. call for emergency assistance, if needed; and/or
3. notify Despatch.

8.2. **MRC5000 Setup (Optional)**

Refer to instructions provided recorder manufacturer for more specific installation notes.

Temperature is retransmitted to the MRC5000 recorder from the controller. Set up the recorder by:

1. Ensure hardware jumper JU1 is in place for the 5 VDC setting (Refer to MRC5000 Manual included).
2. Move MODE to **PROG/TEST/CAL** to display **Prog**.
3. Press ▼ twice to display **Inps**. Move to each Parameter Code using ▼ or ▲. Adjust each Parameter Code using the settings in Table 5.
4. After adjusting all settings, move MODE to **RUN**. Display on both the recorder and controller should read the same.

<table>
<thead>
<tr>

8.3. **Schematics**

The following pages contain electrical and mechanical schematics for the RAD2-13, 2-19 and 2-35 ovens.

---

⁴ These values must match the settings **RetOutLo** and **RetOutHi** on the Protocol 3 Control page. For example, if **RetOutLo** is 32, **EUL** must read 32.

⁵ Change 0-400 chart paper to 0-800 chart paper. Depending on the equipment used, 0-600 paper may be used if the maximum temperature is 260°C (500°F).
